The DuraSeal™ Double Block & Bleed Plug Valve

The DuraSeal™ is a mechanically seated, non-lubricated expanding plug valve that provides a provable bubble tight seal for your most critical isolation applications. Available in both reduced and full-bore options, the DuraSeal™ employs industry proven technology in tandem with robust product innovations to provide consistent DBB/DIB-1 isolation performance. Standing in support of the product lies a world class quality program and dedicated technical and sales teams ready to support your organization's project needs.

The DuraSeal™ meets the following product requirements:

- API 6D, DBB & DIB-1 monogramed
- API 6FA (Firesafe)
- API 591 (Destructive)
- ISO 15848-1 by request (Emissions)
- PED/CE by request
- CRN (Canada) certified
- TSG (China) certified
- Designed, assembled and tested in an ISO 9001 certified/API Q1 compliant facility

Company History

Since 2005, Franklin Valve has been on a mission to supply the oil & gas industry with a quality product, while also leading the industry in customer service and delivery. In 2014 we moved into our current facility, allowing us to better leverage our large inventory and lean manufacturing practices while expanding on our Engineering and R&D capabilities, all with the goal of better serving customer needs.

As we've grown, our **Value Proposition** has remained the same: Franklin Valve offers the highest value on product quality and customer service while leveraging our large inventories to meet and exceed customer lead times. Franklin Valve is globally distributed, represented and approved with high profile end users and Original Equipment Manufacturers.

How the DuraSeal™ Valve Works

An Improved Valve with a Proven History

We took an alternative path. Unlike many valve manufacturers who often strip valves in their quest to reduce manufacturing costs, we have taken a proven double block and bleed plug valve and improved its design.

With the DuraSeal™, you get the proven advantages of a valve that has been considered the standard of quality since 1951. To improve the valve's integrity, we have incorporated a superior slip design and more durable body. To improve performance and longevity, we have incorporated a more reliable stem seal design.

In short, the Franklin DuraSeal™ is made to last - not to make a quick sale.

Field Repairable/Interchangeable Parts

Select 700 series DuraSeal™ parts are completely interchangeable with the original 800 Series General Valve Twin Seal™ double block and bleed plug valve. DuraSeal™ components manufactured from superior materials can upgrade existing TwinSeals™ in the field. The DuraSeal™ can be repaired inline after depressurizing and draining the valve without special tools. Simply remove the valve's lower plate or bonnet and replace the slip/seal assemblies from top or bottom of the valve. Further detail on parts interchangeability is available upon request.

Reliable Double Protection Mechanical Seal

The Franklin DuraSeal™ plug valve seals mechanically. During rotation of the plug there is no abrasion or wear between the sealing surfaces. When the slips reach the closed position, they expand firmly into the valve body creating a primary elastomeric and secondary metal-to-metal backup seal. The DuraSeal™ does not require sealant under any circumstance to seal.

Fast Low Torque Operation

The DuraSeal™ can be easily automated using electric actuators. Torque requirements are low. In smaller sizes only two and one quarter turns can fully open or close the valve.

DuraSeal™ Valve Internal View

Easily Automated with Choice of electric Actuators. DuraSeal™ available in wide range of elastomer materials.

Applications

With bubble-tight fire-safe sealing integrity and the ability to double block and bleed from a single valve, the DuraSeal™ is an excellent choice for applications that require frequent isolation and testing of gas or liquids.

- Product manifolds
- Measurement units
- Isolation of processing equipment
- Loading Racks and Tank Isolation

Franklin Valve reserves the right to change trim codes w/o prior notification

Operations and Applications

VALVE OPERATION

Opening the Valve: Turn the hand-wheel counterclockwise. During this operation, the plug is raised while the slips are retracted away from the body. When the slips are fully retracted from the body seating area, the plug is then able to rotate 90 degrees to the fully open position. When the valve is in the fully open position, the slips and slip seals are completely protected from line flow.

Closing the Valve: Turn the hand-wheel clockwise. During this operation, the retracted plug and slips are rotated 90 degrees without body contact. This rotation continues until the slips are positioned over the up- stream and downstream port areas. Continued rotation of hand-wheel mechanically forces the plug down- ward and forces the slips outward to seal firmly against the valve body. This produces a secondary metal to metal seal on both upstream and downstream areas providing double isolation.

APPLICATION NOTES

- **Biofuels Product Isolation:** Secure sealing of Biofuels is critical in protecting the environment. The DuraSeal™ DBB Valve with its verifiable secure shutoff is perfect when process must be contained.
- **Multi-Product Manifolds:** Some pipeline manifolds need to flow various products (e.g. diesel, jet fuel, gasoline, etc.) reliably and without contaminating one another. This DuraSeal™ DBB Valve is used to provide positive shut off and zero leakage to prevent cross contamination.
- **Prover Loops:** In prover loops, the calibration of flow meters requires that every valve in the system must have zero leak rates. Any leak could mean an error in calibration. The DuraSeal™ DBB Valve is used to ensure that when the valves in the system are closed, they are leak tight.
- **Custody Transfer Units:** Transfer of valuable media relies on accurate measurement of product. The DuraSeal™ DBB Valve provides secure tight shutoff ensuring that the transfer is accurate.
- **Terminals:** Loading and unloading tanker vessels requires positive sealing in order to prevent spillage into the water. The DuraSeal™ DBB Valve provides such positive sealing and is the most reliable in the market.
- **Tank Farms (Oil Depots):** Valves used for tank isolation needs to work reliably with zero leak rate. These valves are also operated frequently. The DuraSeal™ DBB Valve provides a reliable long-term high integrity seal designed for frequent use with verifiable zero leak.
- **Aviation Fueling Systems:** Fuel hydrants at airports need to allow for quick maintenance, repair, leak locating and testing. This requires a valve that can close quickly and positively seal off the relevant sections. The DuraSeal™ DBB Valve's variable zero leak rate ensures that maintenance, repair, leak locating, and hydrant testing can be done quickly and safely. Import/Export Facilities.
- **Offshore Platforms:** Secure shutoff is imperative on an offshore platform in that leakage can result in contamination of the water and possible equipment damage. The DuraSeal™ DBB Valve is the best choice for low pressure positive shutoff.
- **Blending Units:** The accurate blending of high-grade fuels requires valves of high sealing integrity to insure accurate addition of additives in blending operations.

(1) ENP Bore available. (2) In Accordance with NACE MRO175 Latest Edition. (3) Manganese Phosphate Coating available. (4) See Additional Options Below.

(5) NACE Specification Available.

Proper seal selection requires a number of considerations such as media, pressure class, differential pressure, low temperature, high temperature, seal type, etc. To that end we have included a selection of slip seal materials and a brief list of considerations:

Fluoro Elastomers Slip Seal Materials (FKM)

VGF	Viton* GF	Viton* with Enhanced Chem. Resistance, Our Standard Material
VGFLT	Viton* GFLT	Low Temp Viton* GF
VE	Viton* ETP (Extreme)	Viton* with Chem. Resistance rivaling FFKM

Pefluoro Elastomers Slip Seal Materials (FFKM)

KRZ	Kalrez*	Kalrez* with High Chem. Resistance
-----	---------	------------------------------------

All specifications and materials are subject to change without notice. Alternate seal materials may be provided upon request.

*Generic equivalents provided.

Varying levels of Fiber Reinforced elastomers available on all slip seals materials by request.

90 Durometer elastomers offered on ANSI 600 & 900 valves.

Preferred Mounting Positions

1.0 SCOPE OF INSTRUCTION

- 1.1 This information is provided for support of the DuraSeal™ Valve in maintaining the maximum life and function of the valve.
- 1.2 The contained information is subject to change without notice.
- 1.3 This document provides information for typical installations. In the event of unique situations, please contact your representative or the factory.

2.0 DEFINITIONS

- 2.1 **DBB** - Double Block and Bleed, method to test seat integrity with valve closed while under pressure.
- 2.2 **DIB-1** - Double Isolation and Bleed, Bi-Directional seating. API 6D definition of redundant sealing surfaces in both flow directions.
- 2.3 **DTR** - Differential Thermal Relief, provides the cavity relief functions of API 6D. Also contains DBB bleed function.

3.0 CONSIDERATIONS

- 3.1 Positioning of valve to provide operational access in installation. This is of particular concern for manually operated valves in pipe racks. Operator and handwheel extensions are available to improve access. See PUB-002-EN for details on the extension of DTR systems.
- 3.2 Positioning of DTR to provide proper function. The DTR relief direction should be toward the pressure side to be isolated. In a typical piping system, there is often a specific direction. When isolating equipment such as pumps, the preferred isolation may be different from the prevailing flow direction. See PUB-002-EN for DTR details.
- 3.3 Positioning of bleeds and drains to provide adequate operation. On valves which require complete draining, ensure that drains are positioned to provide complete draining. On valves which require DBB operation, it is typically preferable to position bleed valves for an elevated position so that DBB bleeds the minimum amount of liquid.
- 3.4 Positioning for reducing damage due to solids contained in fluids. With solids in the fluids, it is preferable to have regular draining of the body cavity to reduce accumulation and reduction of performance. It is also preferable to have the DTR to the upper side so that solids do not damage the DTR checks or valves.

4.0 PREFERRED MOUNTING POSITIONS

- 4.1 Positioning of the stem facing up in the vertical position is preferable.
- 4.2 700 Series: 12" or smaller 150 & 300 class and 6" or smaller 600 & 900 class may be oriented with a horizontal stem position.
- 4.3 600 Series: 10" or smaller 150 & 300 class and 4" or smaller 600 & 900 class may be oriented with a horizontal stem position.
- 4.4 If the valve is oriented with the stem in the horizontal position, it is preferable that the left flange is receiving the prevailing flow and that the DTR is on the upper side. This provides an inlet flow upon opening that tends to flush out any accumulated solids.
- 4.5 Mounting of the valve with the waterway oriented vertically is acceptable. This provides an inherent cavity flushing characteristic in both the upward and downward flow directions.
- 4.6 Mounting the valve with the stem facing down is non-preferred but may be acceptable for very clean conditions. This exposes the stem and stem seals to potential damage from settling solids and exposes the DTR to potential accumulations.

WHEN ORDERING ELECTRIC MOTOR OPERATORS, SPECIFY THE FOLLOWING:

INSTALLATION

1. Mounting style
2. Valve installation attitude
(for proper location of breathers and drains)

TYPE OF VALVE

3. Valve figure number
4. Size
5. ANSI rating

OPERATING CONDITIONS

6. Differential pressure in PSI
7. Operating time in seconds

ELECTRICAL DATA

8. Explosion proof NEMA VII or weatherproof NEMA IV
9. Phase, Cycle, Volts - controls and motors

SPECIAL FEATURES

10. Gear limit switch (2 or 4 train)
11. Reversing controller (if separate, it is to be explosion proof NEMA VII, or weatherproof)
12. Breather or drains, if desired
13. Space heater, if desired
14. Control transformer, if desired (specify voltage)
15. Other special requirements

The DuraSeal™ Valve is by Design a Bidirectional DIB-1 Valve:

This design has inherent characteristics of trapping body cavity pressure. Because valves in liquid or condensing service can have a thermal hydraulic expansion within the trapped cavity, API 6D requires a cavity pressure relief system. The valves on the configurations permit different directionality characteristics.

These configurations relate to the operational reliefs and DBB operation. The lower body bleeds are not addressed in this document but should be used as necessary to eliminate line solids from accumulating under the plug.

For the following configurations, the left flange (when facing the piping of an upright valve) is the upstream flange. For installations with clearance issues, a reverse DTR may be ordered which provides the right flange as the upstream flange.

The upstream flange is the flange of preferred pressure isolation. Depending upon the required isolation, the valve preferred pressure direction may not be the direction of flow. For applications where a piece of equipment is being isolated from the piping, the preferred pressure isolation will typically be the flange away from the equipment.

Extending of the Body Bleed Outlets: For convenient bleed positions, the body bleed outlets may be extended from the NPT outlet of the manual bleed valve. This shall retain the original bleed valve for interim isolation.

Standard DTR

**Optional Line Relieving
DTR**

**Automatic Body Bleed
DTR**

Standard Differential Thermal Relief (DTR)

This configuration is acceptable for liquid service.

The BODY BLEED VALVE is only for the purposes of manually venting the body cavity and DBB testing.

When not being used for bleeding, the body bleed valve should be closed and the outlet should be plugged.

The UPSTREAM ISOLATION VALVE must be left open for cavity relief to function.

It should only be closed for maintenance and leakage management in the event of damage.

Directionality Characteristics of Valve Are Shown Below

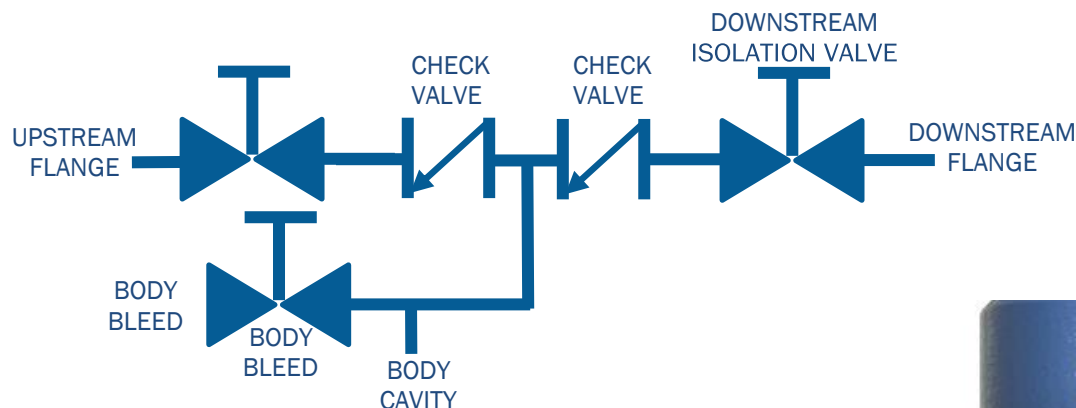

Optional Line Relieving Differential Thermal Relief (LRDTR)

This configuration may be used to relieve trapped piping downstream from the valve. Downstream isolation valve must be closed for DBB confirmation.

When not being used for bleeding, the body bleed valve should be closed and the outlet should be plugged.

Directionality Characteristics of Valve Are Shown Below

Automatic Body Bleed Differential Thermal Relief (ABBVDTR)

This configuration allows for automatic venting of body cavity pressure to an external customer designated location upon closure of the valve.

This allows for visual confirmation of seal integrity as well as preventing thermal expansion in the valve cavity.

The bleed valve is actuated by the operator mechanism, opening when the DuraSeal™ is seated, and closing once the DuraSeal™ begins to travel open.

The needle valve should remain open during operation and should only be closed for maintenance and leak management in the event of damage.

Directionality Characteristics of Valve Are Shown Below
